Book Surgery of the Meniscus

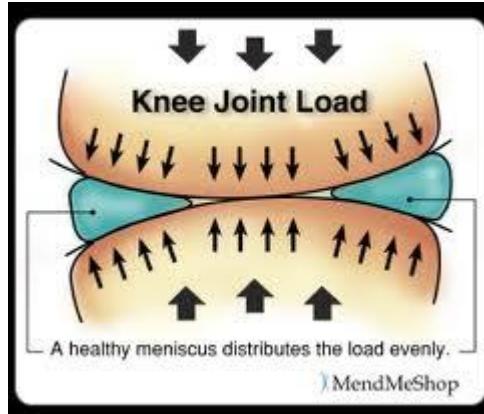

ESSKA 2016

- Chapter 15

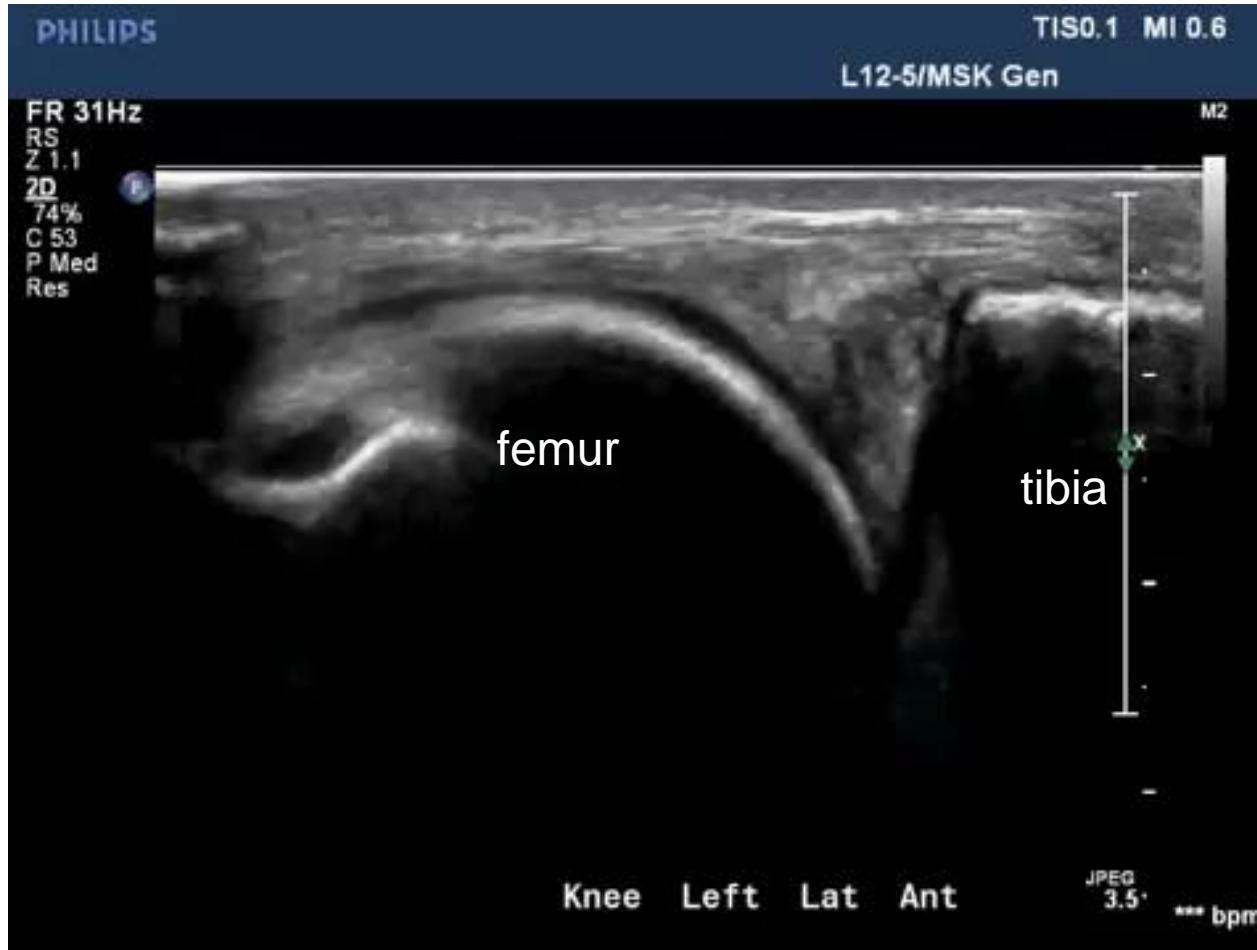

Meniscus lesions

- Conservative treatment
 - Operative treatment
 - Meniscal repair
-
- Important factor
 - Ligamentous insufficiency

Dynamic HR meniscus ultrasound

Equipment developments

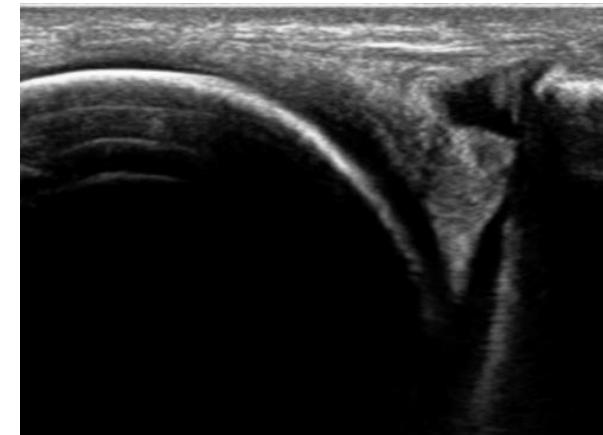

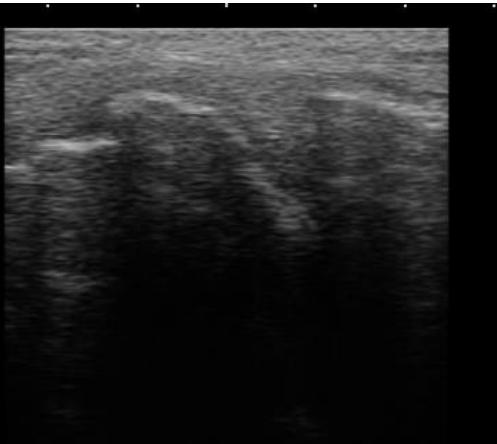

- High resolution probe 2-22 MHz 1920 piezoelectric elements and sono CT software improvement , processor +++
- Non mobile ultrasound tower
- Linear probe > deeper images

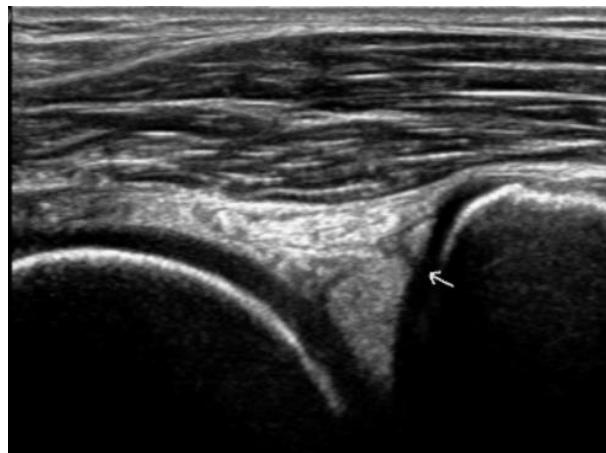

ICONE

Improvements image quality

2006-2008 2008-2010 2011-2014

2015-
2018

Meniscus ultrasound literature

MRI vs MSU meniscus

2008 JBJS -B

Shetty et al London

2014 J Knee Surgery

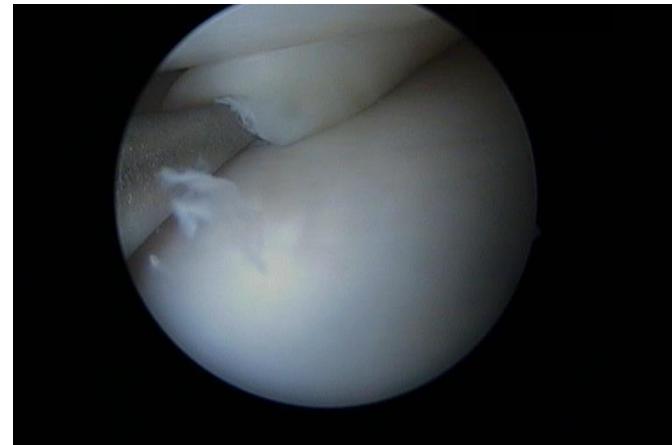

Cook et al Missouri USA

JBJS 2008 // J Knee Surgery 2014

- Arthroscopy – US – MRI
- 35 patients chronic 2008 // 71 patients acute 2014
- Sensitivity US 86 % MRI 86 % // US 91 % MRI 91 %
- Specificity US 69 % MRI 100 % // US 84 % MRI 66 %
- Pos PV US 83 % MRI 100 % // US 94 % MRI 84 %
- Neg PV US 75 % MRI 81 % // US 76 % MRI 80 %
- Shetty BJBS Br 2008 // Cook et al USA
- MRI not able to detect all lesions
- US dynamic MRI static

MRI might not be golden standard

- Collateral lesions lateral / ALL / Segond MRI not reliable (Devitt / Feller / Whitehead KSSTA 2017)
- RAMP (MRI) Hidden lesions B Sonnery Cottet 2015
- False negative (MMPH) in ACL # Ahn 2016 45%

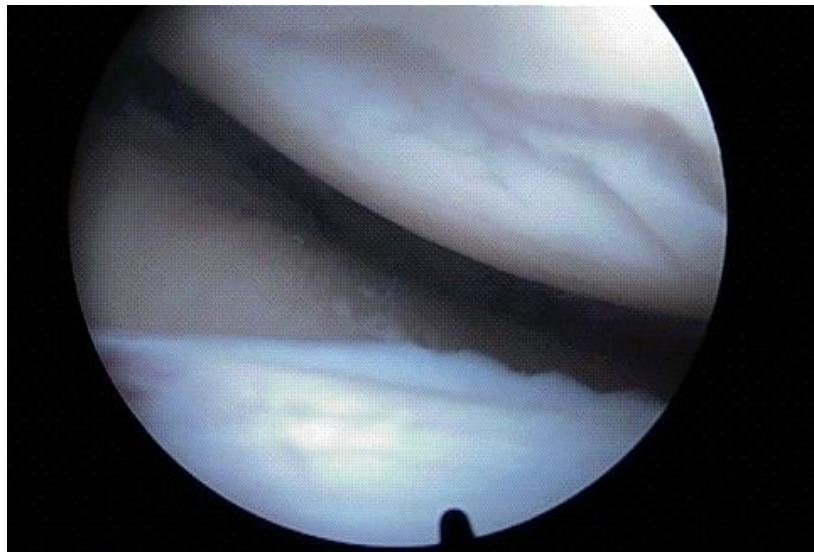

Ultrasound positions

prone ,rotation, supine ,hyperflexion

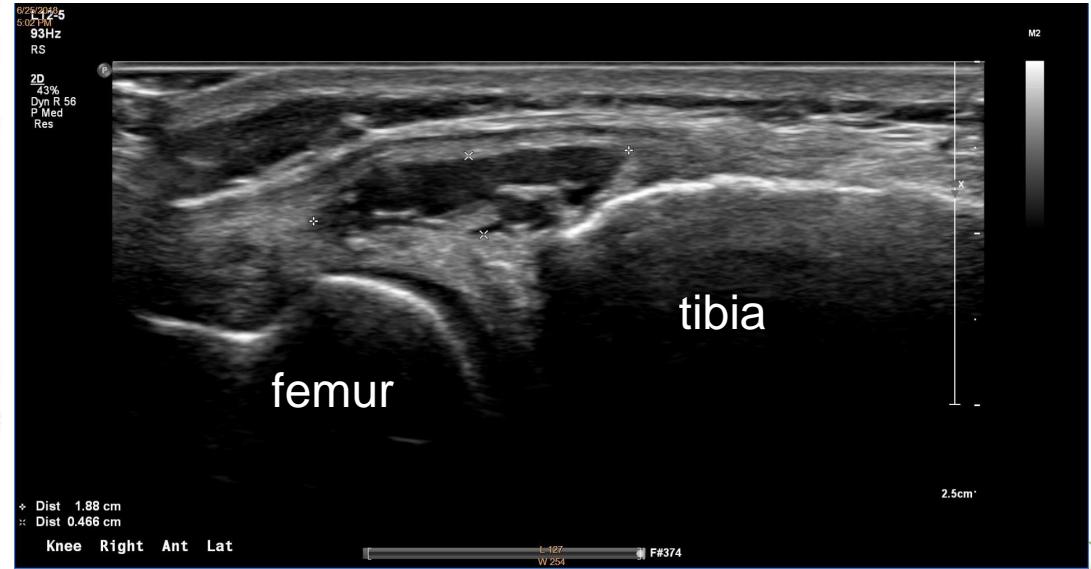

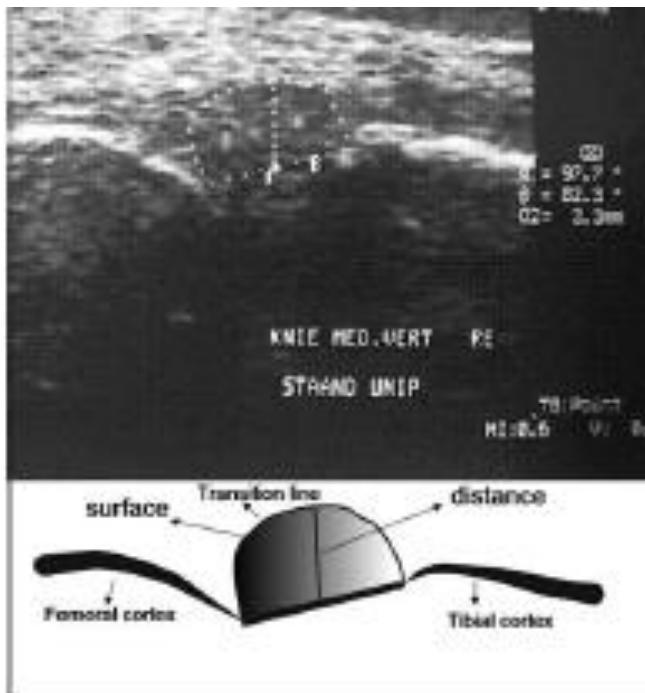

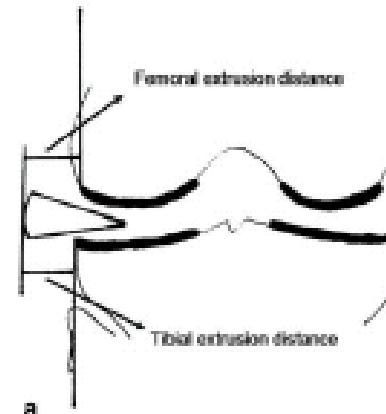

Meniscus US > Arthroscopy

Meniscus signs

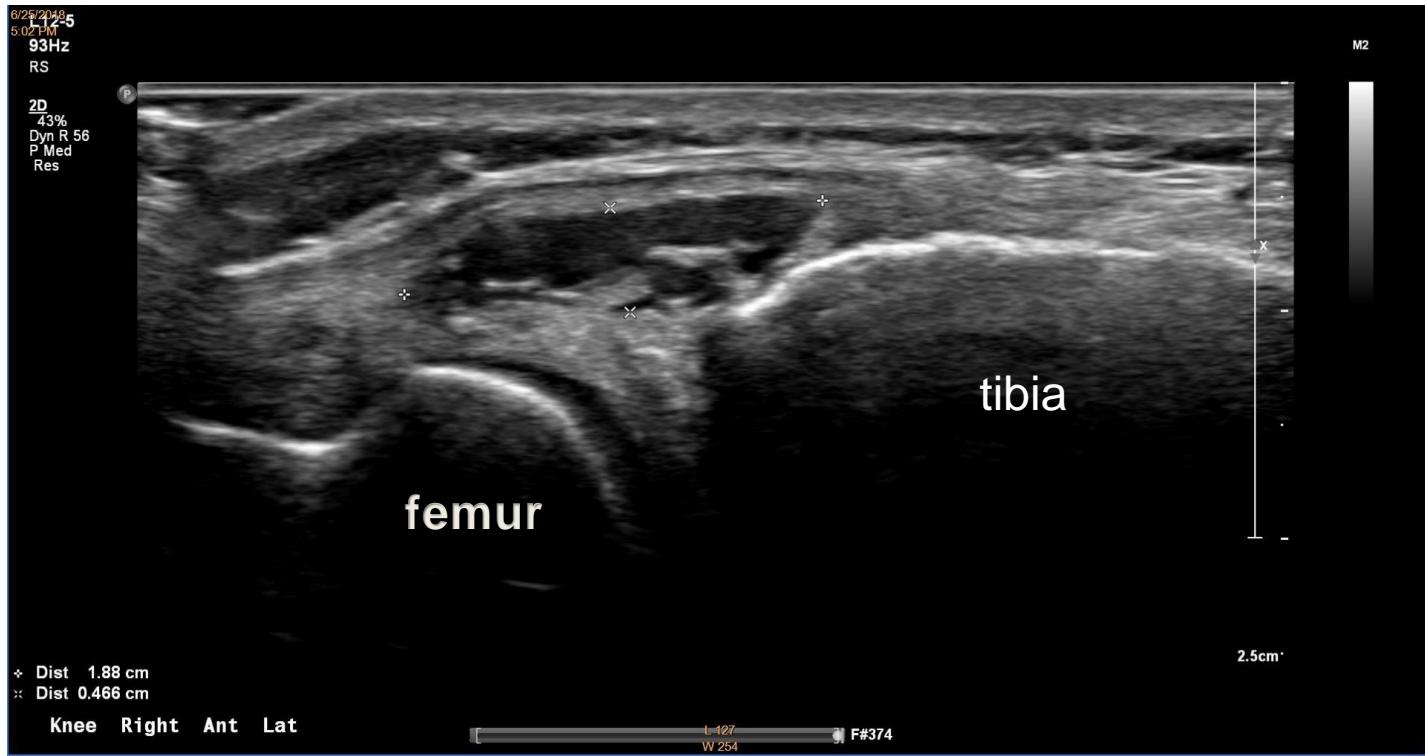

courtesy P Verdonk

- Lesion vs degeneration
- Protusion 3-4 mm
- Fluid / cyst formation

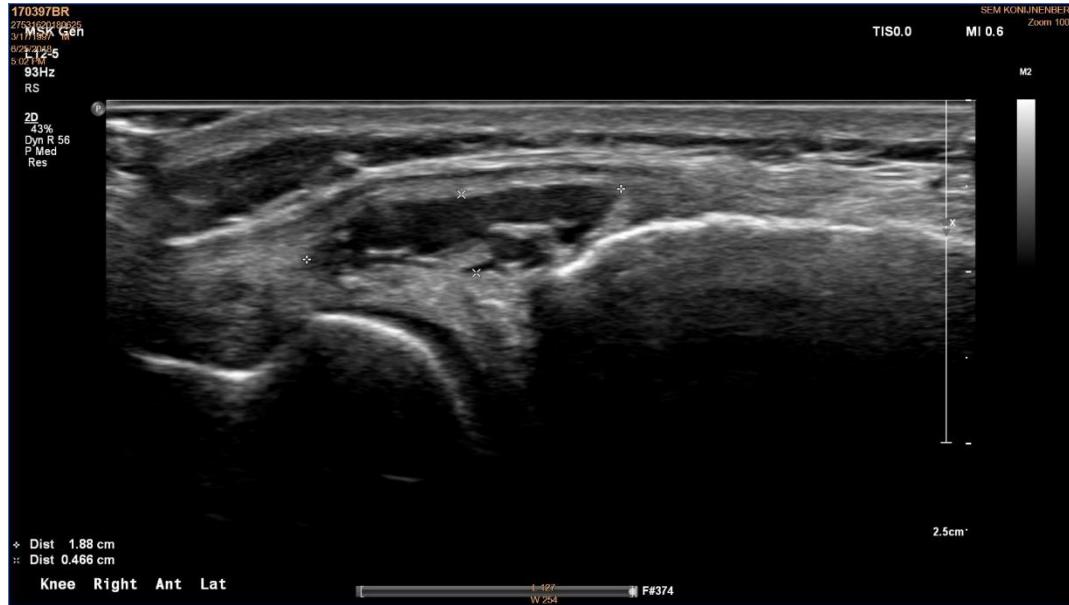

Meniscus cysts

- Lateral meniscus with radial tear .
- Outside layer of cyst (thick/thin) might predict need to resect the cyst wall .

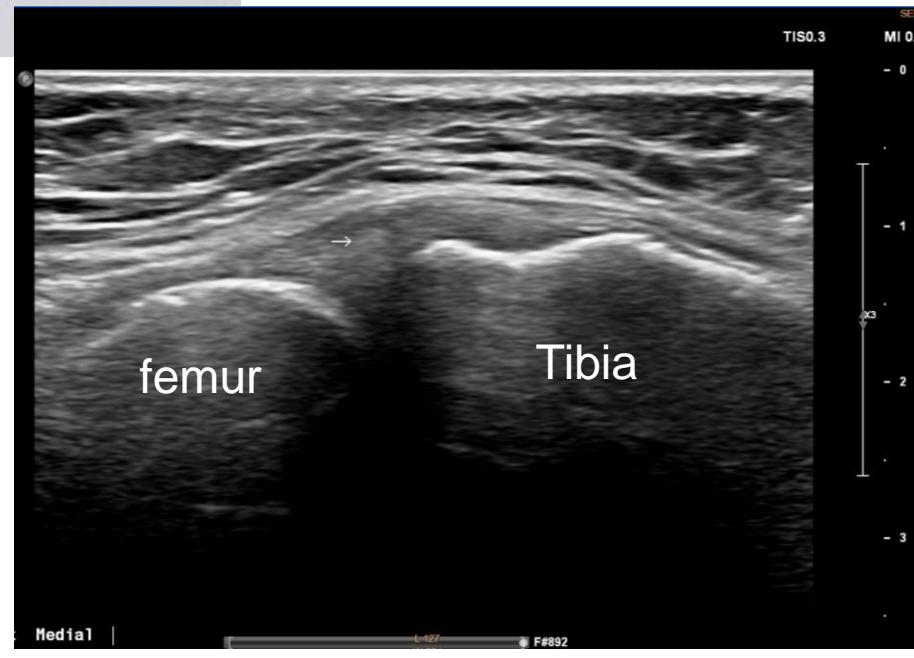

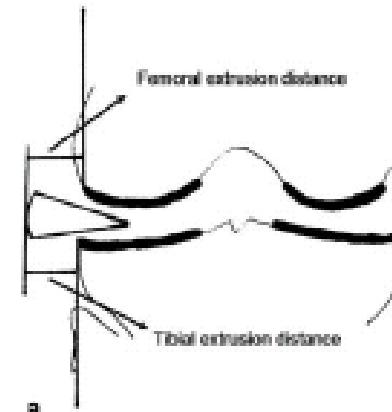

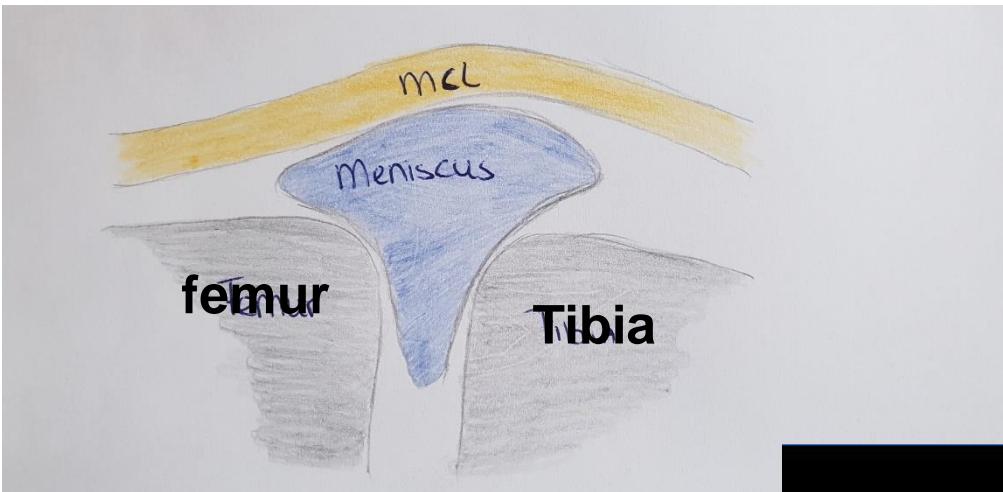

Meniscus cyst intervention

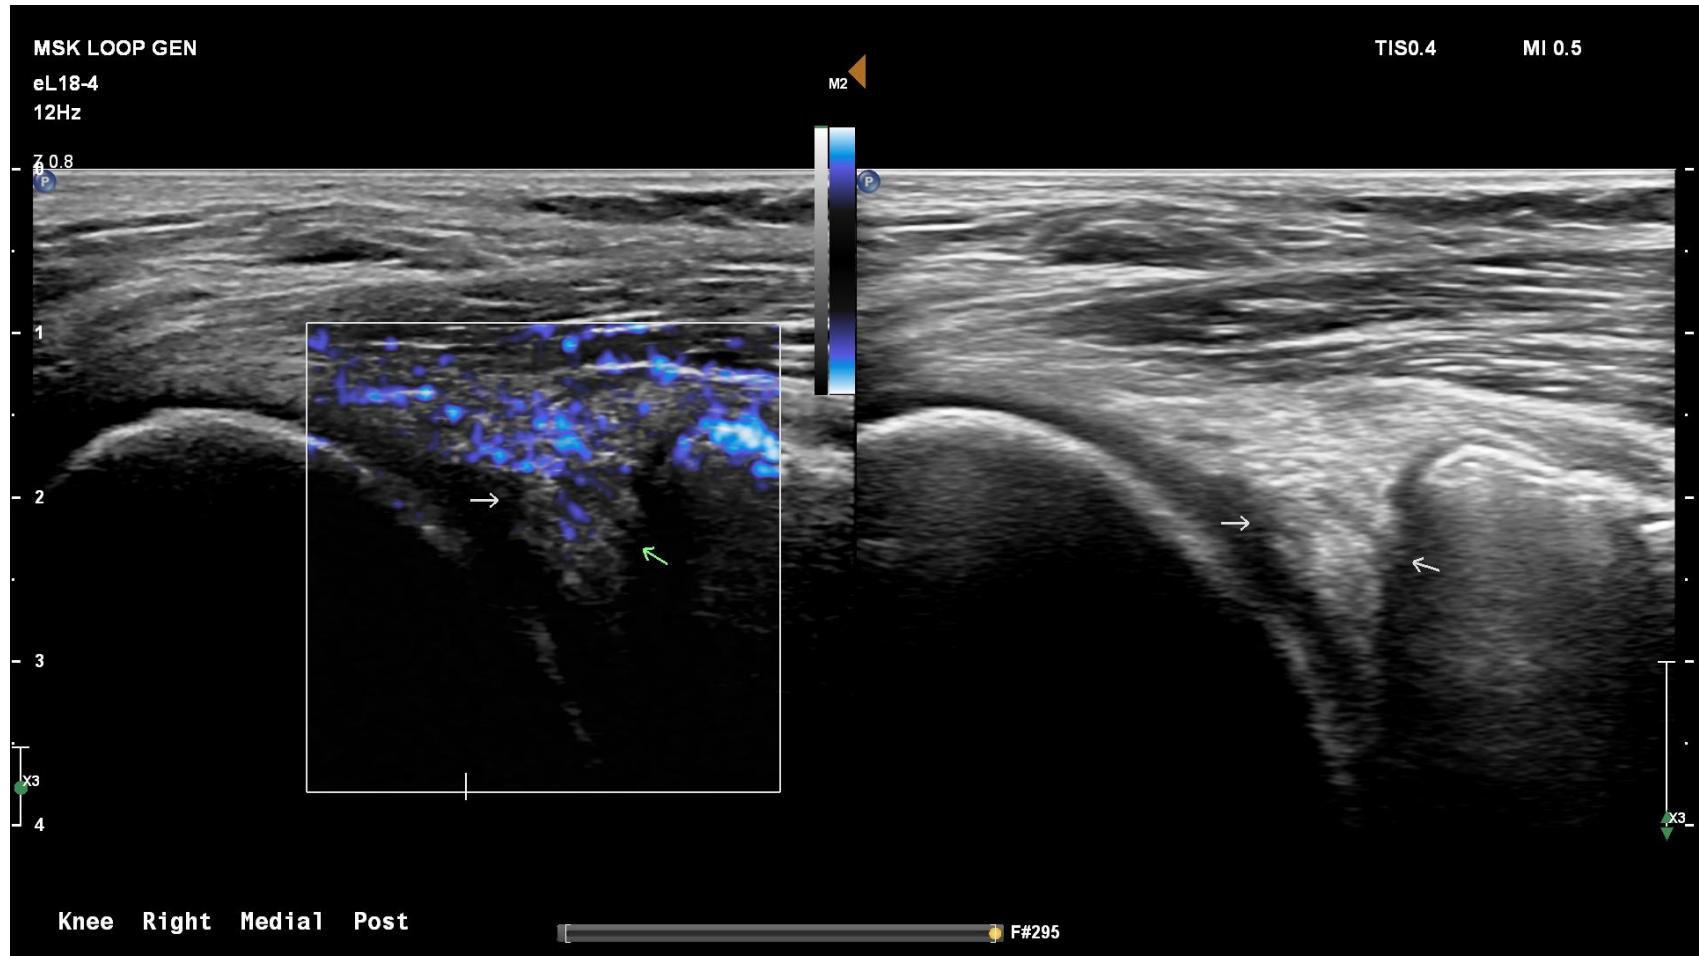

punction ,
aspiration,
injection

Meniscus extrusion

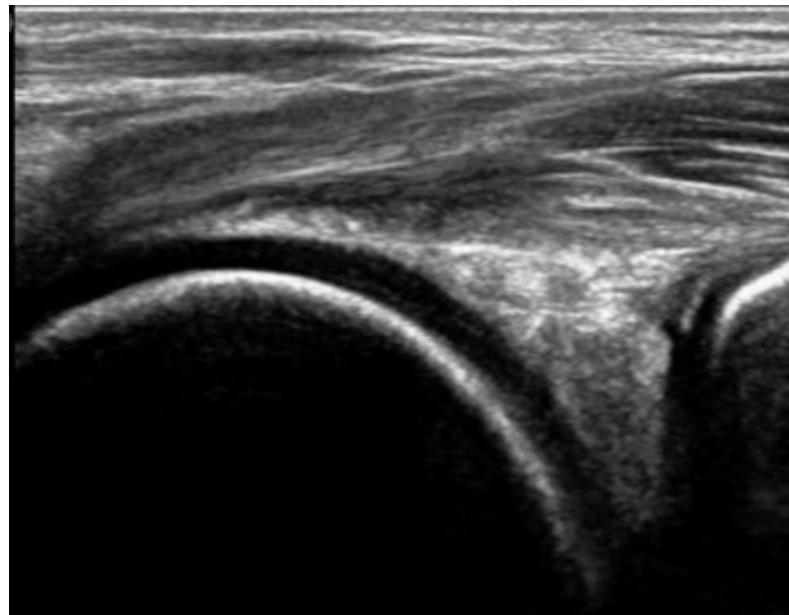

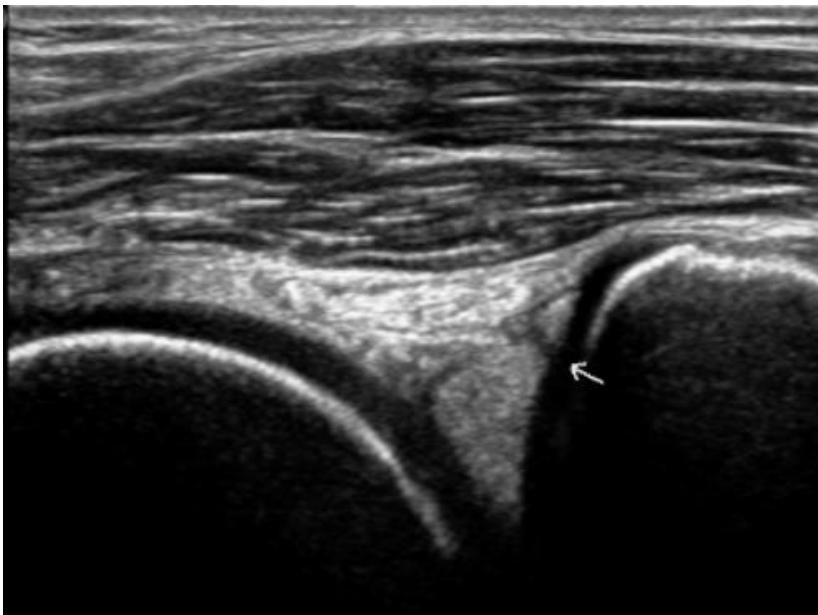

Meniscus vascularisation

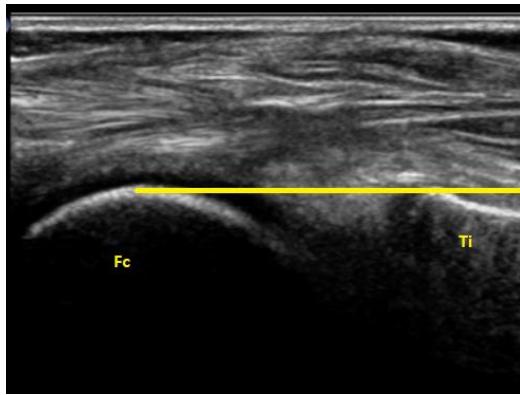

ICONe

Sequential follow up in ACL / monitoring the meniscus @ 4 weeks conservative treatment

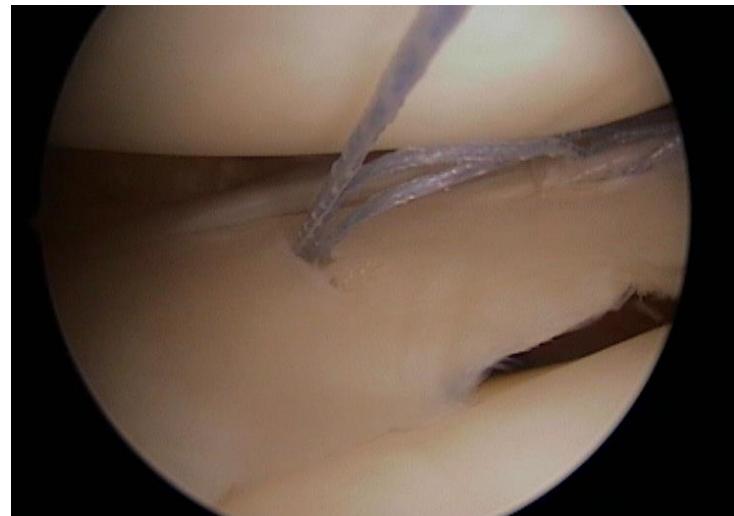

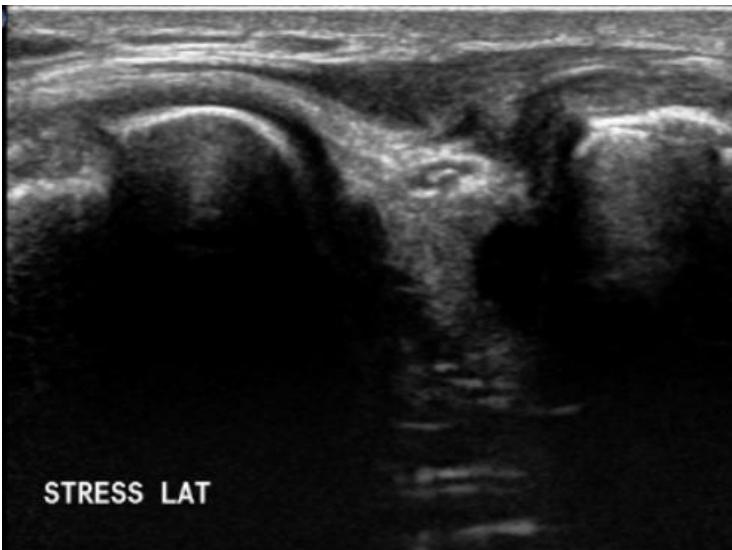

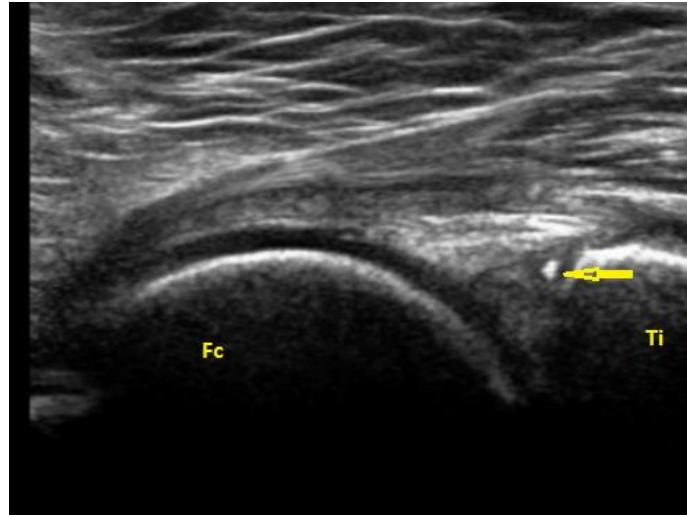

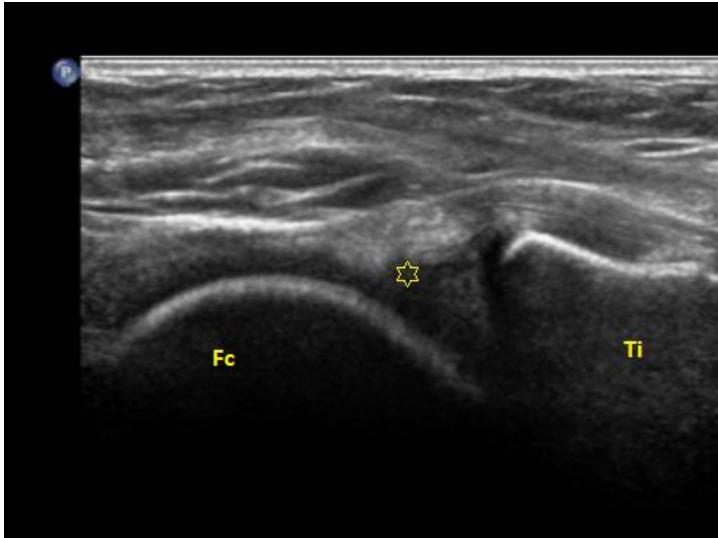

ICONE

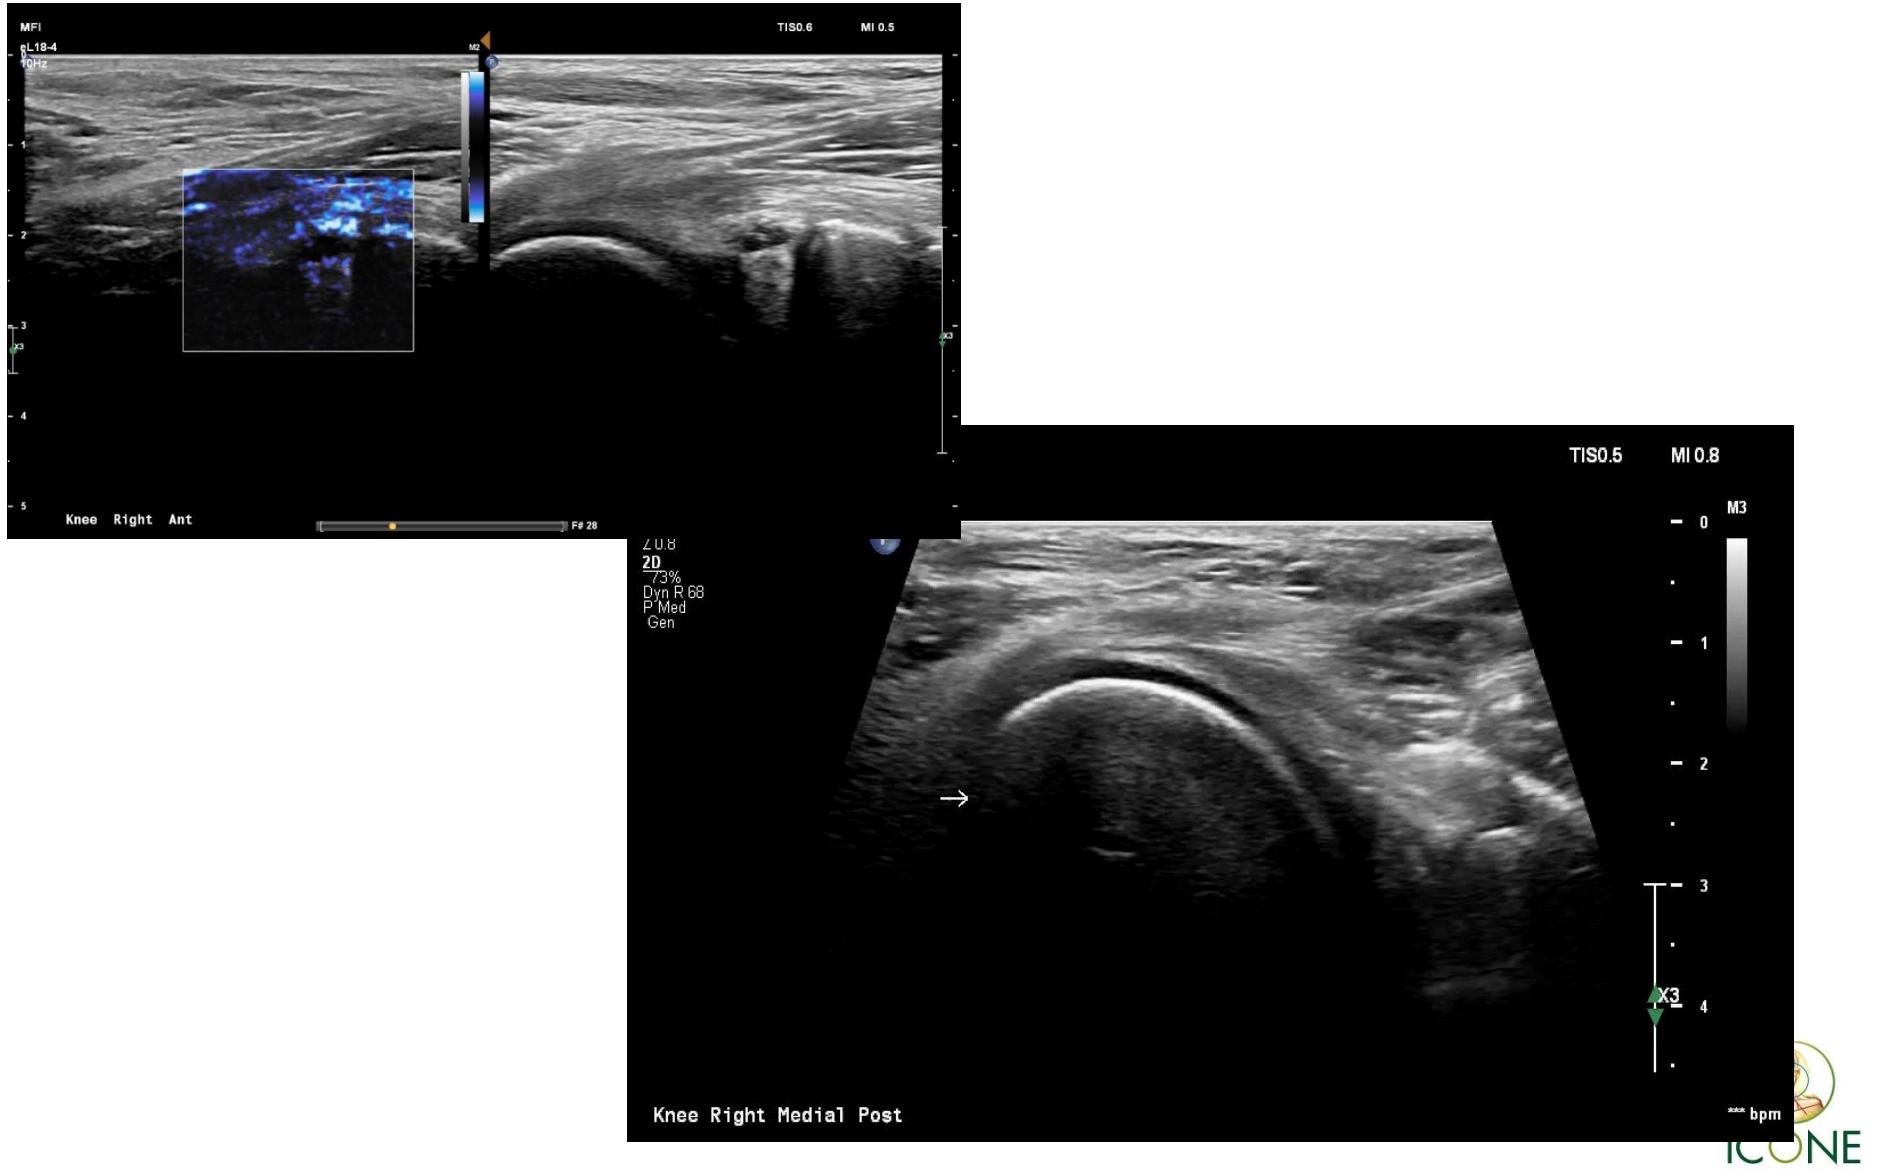

Meniscus / ACL def

Meniscus repair follow up

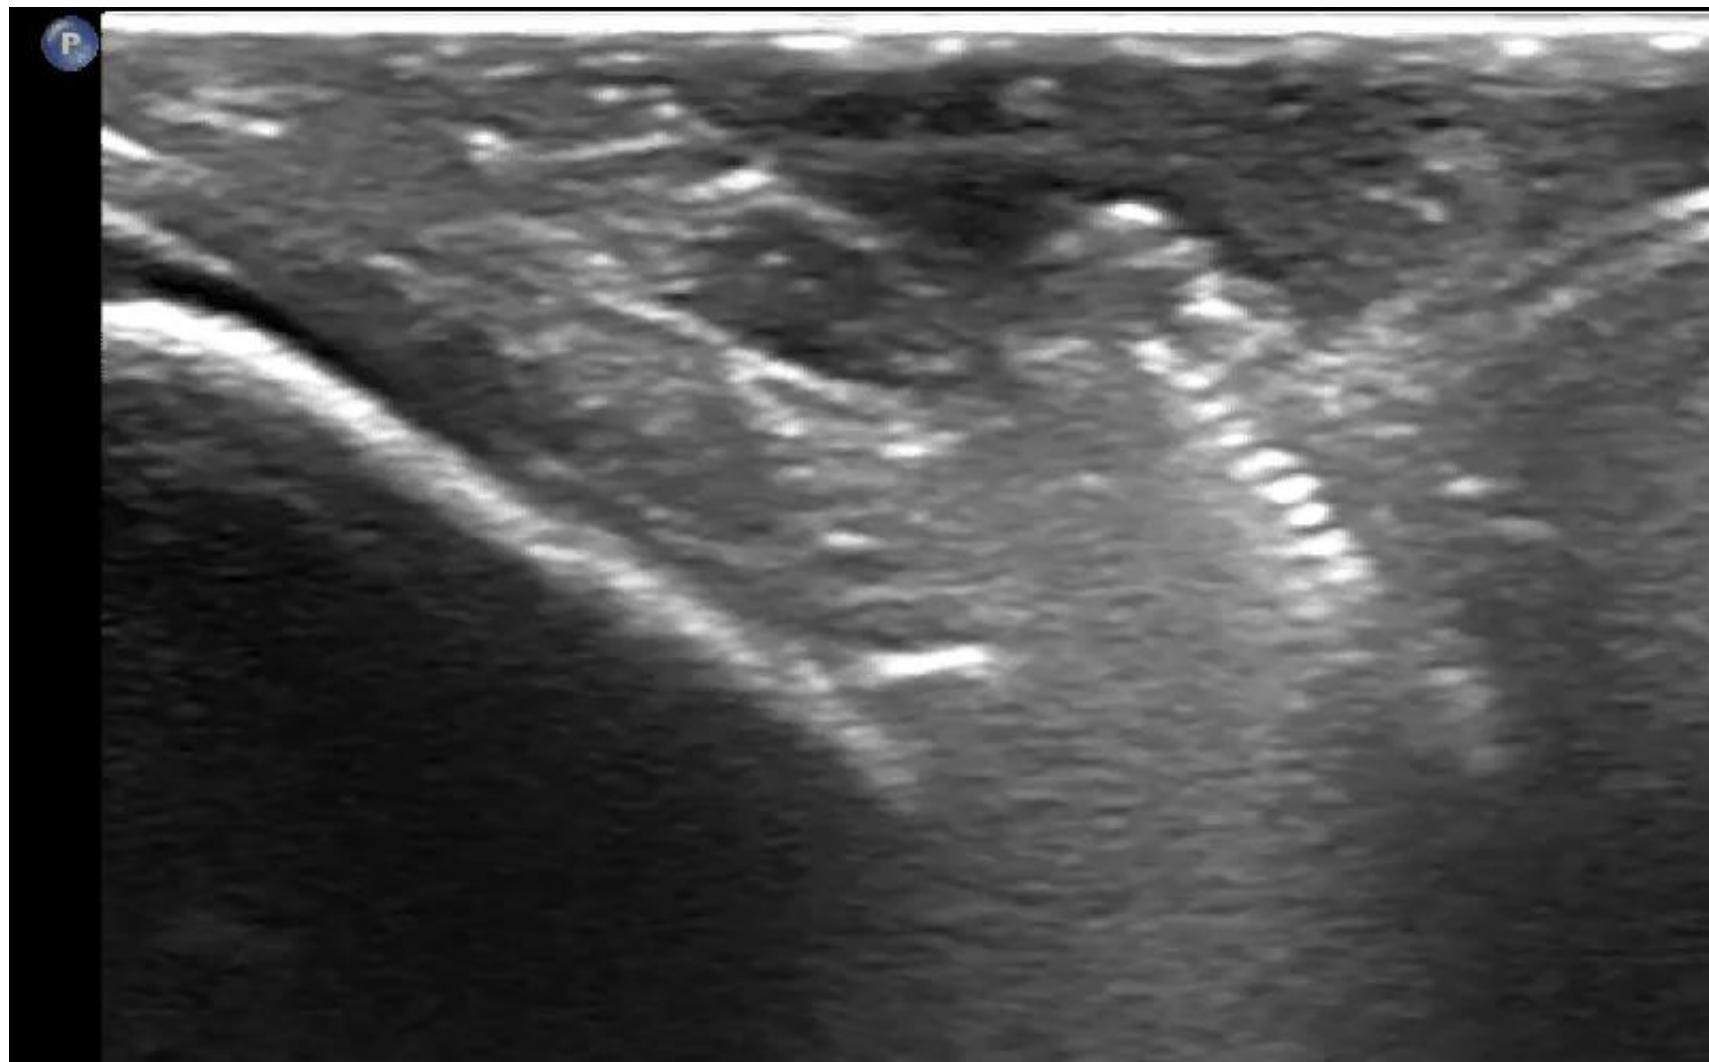

Meniscus trephination

Meniscus Ramp lesion

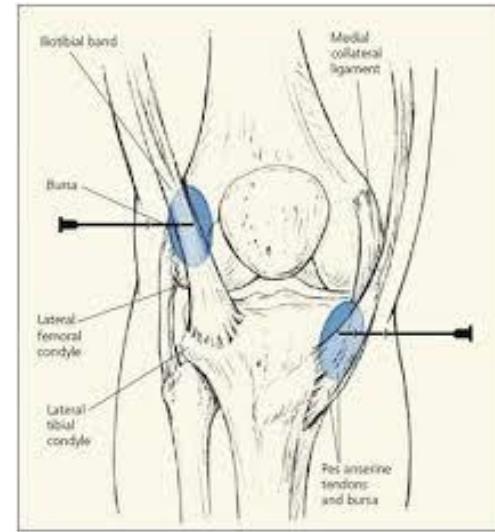

Pig meniscus > repair

Post operative imaging

- Meniscus residual lesions ?
- Pes anserinus ?
- Healing repaired meniscus ?
- DVT ?
- For these conditions MRI is not helpful in the short term (0-3 months)
- We use dynamic HR ultrasound if there is any problem in rehab .

Conclusion

- Dynamic HR ultrasound usefull for meniscus pathology especially :
- Instability combined cases
- Follow up , postoperative conditions
- Monitoring healing /conservative treatment
- Repairability (vascularisation)
- Intervention
